

She's a Democrat, he's a Republican. She spends her days fighting global warming at an environmental non-profit, he makes his living doing PR for Bell Motors and their fleet of SUVs. But as soon as they meet, Emily Crossley and Robert Drake realize they have encountered their intellectual match. You're never challenged, he tells her. You've surrounded yourself in a cocoon of people who think exactly the same way you do. She hurls the same accusation back at him, and the fiery debates begin. Despite both of their attempts to derail it, there is no denying that they are falling in love. But their relationship is threatened by political differences, Robert's excessive work hours, and Emily's fear of losing her identity as she falls deeper in love. Can their love survive? *The Drake Equation* is a tale of modern love and all its complexities.

The Drake Equation is used to estimate the number of communicating civilizations in the cosmos, or more simply put, the odds of finding intelligent life in the universe. $N =$ The number of civilizations in the Milky Way galaxy whose electromagnetic emissions are detectable. 15 Dec - 6 min - Uploaded by BrainStuff - HowStuffWorks Josh explains Frank Drake's famous formula for determining whether intelligent alien life. The Drake Equation is an attempt to encapsulate all the variables that would be relevant to establishing the number of intelligent civilizations that existed in the Milky Way galaxy and which were broadcasting radio signals at this particular point in time. The Drake Equation is composed of seven terms. That's where the famous Drake Equation "named after astronomer Dr. Frank Drake" comes into play. Developed in the 1960s, this equation. For example, SETI, the search for extraterrestrial intelligence, got its start in Green Bank. Here, in 1960, Dr. Frank Drake, a young radio astronomer, pointed an antenna at the stars and asked: Are we alone in the universe? Is there life on other planets? Or has the Fermi Paradox kicked in? Tune this interactive Drake Equation calculator to reveal the answer. In 1951, Enrico Fermi famously asked the question, "Where is everybody?" It wasn't because his retinas detached; it was because he was. The Drake equation is one of astronomy's most famous attempts to answer the question: Are we alone? It asks not just about any life, but the top. The Drake equation, to be specific, said that the number of civilizations (N) we have at any given time within our galaxy, is equal to the product.

equation by adding a number of other factors they consider crucial to having technologically advanced civilizations. With this in mind, we should approach the Drake equation. In the past, experts trying to make sense of the Fermi Paradox have looked to the Drake Equation to put a numeric value to the likelihood that intelligent life exists. Juggling all the factors impacting the emergence of extraterrestrial civilizations is no easy task, which is why the Drake equation has become so important.

With Dallas Campbell, Nicola Clayton, Paul Davies, Frank Drake. A look at the Drake equation, developed by Dr. Frank Drake as a way to think about the possibility of intelligent life. The Drake Equation, as it came to be known, was formulated in 1961 and is generally accepted by the scientific community. Play with our interactive graphic to work out how many intelligent civilizations there could be.

in our universe.
